

BIMS Dashboard Analysis Report

World Bank Loan Disbursement & Project Risk Assessment

June 28, 2026

Executive Summary

This report synthesizes insights from three comprehensive Power BI dashboards tracking the World Bank's global loan disbursement and project portfolio. The analysis reveals critical data quality issues requiring immediate attention, alongside actionable fraud detection flags and geographic portfolio insights.

Key Findings

- 42 projects flagged as Potential Fraud requiring immediate audit investigation
- Data quality issues: negative duration values (-12K days) indicating authorization order violations
- 27,615 total active projects across 160 countries with extreme duration variance (60-year span)
- 44.71% of portfolio in Closed status; only 43.7% Active, indicating mature/declining portfolio
- Geographic concentration in Latin America and Eastern/Southern Africa dominates project counts

Critical Actions Required

1. Initiate audit workflow for 42 Potential Fraud flagged projects immediately
2. Clean data quality issues affecting duration calculations before further analysis
3. Investigate regional performance disparities and underserved markets
4. Review historical project spike post-2000 to understand portfolio composition change

Dashboard Overview

Three integrated dashboards provide comprehensive visibility into loan disbursement performance, project risk lifecycle, and global geographic distribution:

Dashboard	
Dashboard 1: Loan Disbursement Tracking	
Dashboard 2: Risk Lifecycle & Analysis	
Dashboard 3: Global Footprint	

Focus Area

Regional performance, disbursement duration analysis, risk stratification, and individual project tracking

Project status distribution, risk trends over time, historical pattern analysis, and status-risk correlation

Geographic distribution of 28,015 area projects, country-wise breakdown, and location-based portfolio insights

Dashboard 1: Loan Disbursement Tracking

Key Metrics	Metric
Total Projects Tracked	
Min Disbursement Duration	Max Disbursement Duration
Geographic Coverage	

Value

- 28,020 active records
- 12,000 days (fraud indicator)
- 22,000 days (~60 years)
- 9 primary regions tracked

Critical Insights

- 1. Negative Duration Anomaly: A minimum duration of -12,000 days reveals a severe data quality issue. Negative values indicate that Loan Effective Dates precede Board Approval Dates, which is logically impossible. This suggests either data entry errors, intentional backdating, or system issues that require immediate investigation.
- 2. Regional Concentration: Latin America and Eastern/Southern Africa dominate project counts, with Latin America leading at 5.28M+ disbursements. This concentration may indicate strategic focus or historical lending patterns that should be evaluated against market opportunity.
- 3. Duration Variance: The 60-year spread (12K to 22K days) suggests either multi-phase projects with extended timelines or significant measurement inconsistencies. Europe and Central Asia show longer average durations, potentially indicating complex project structures.
- 4. Active Project Distribution: Detailed regional breakdown reveals active project counts varying from 521M (Other) to 5.76B+ (Latin America). These disparities warrant investigation into staffing, risk profiles, and market conditions.

Dashboard 2: Risk Lifecycle & Analysis

Key Metrics Status	
Active	

Count

2,646 (43.7%)

Closed	
Dropped	
Pipeline	

Fraud Detection Risk Classification Potential Fraud

Low Risk	

18,130 (44.71%)

6,910 (24.62%)

Small percentage

Count

42 projects (Audit Priority)

80 projects (Baseline)

Critical Insights

- 1. Portfolio Maturity: With 44.71% of projects in Closed status and only 43.7% Active, the portfolio appears mature or declining. This suggests either successful project completion or lack of new project initiation.
- 2. Fraud Flags: 42 projects flagged as Potential Fraud present an actionable audit queue. The concentration of these flags in Closed/Dropped status (rather than Active) suggests legacy issues, making investigation feasible without operational disruption.
- 3. Historical Spike Post-2000: The multi-line chart reveals a dramatic surge in projects post-2000, particularly in Dropped status (orange line). This inflection point warrants investigation—possible causes include portfolio expansion, market downturn, or data quality issues.
- 4. Risk-Status Correlation: Most Potential Fraud projects concentrated in Closed/Dropped status suggests these may be historical compliance issues rather than current operational threats. However, the data quality concerns identified in Dashboard 1 complicate attribution.

Dashboard 3: Global Footprint Key Metrics

Portfolio Dimension	Regional Projects	Country-wise Projects	Area Projects
Lending for Project Status			

Value

4,200

160 countries

28,015

348 tracking categories

Geographic Insights

1. Global Distribution: With presence in 160 countries and 28,015 area projects, the World Bank maintains comprehensive geographic coverage. However, clustering analysis reveals concentration in developed regions.

2. Regional Imbalance: Europe and Asia show dense project clustering, while Africa—despite representing large land mass and population—shows sparse coverage relative to need. This suggests potential underserving of high-risk regions or alternative lending mechanisms for African markets.
3. Regional vs. Country Segmentation: The 4,200 regional projects versus 28,015 area projects indicates hierarchical project management. Regional aggregates enable macro-level oversight, while area projects provide granular tracking.
4. Strategic Opportunity: The relatively low project density in underserved regions (Latin America and Africa outside major metros) may represent growth opportunities or constrained markets requiring alternative approaches.

Cross-Dashboard Analysis

Integrated Findings Pattern	
Data Quality Crisis	
Fraud Concentration	
Geographic Risk	
Portfolio Lifecycle	

Evidence & Implication

Negative durations (-12K days) combined with 60-year variance suggests systemic issues. Duration data unreliable for performance evaluation until cleaned.

42 Potential Fraud flags predominantly in Closed/Dropped projects. These appear to be legacy issues rather than active operational threats, enabling focused audit.

Latin America has highest project volume but concentrated risk. Africa significantly underserved. Risk profile may correlate with geographic maturity of portfolio.

44.71% Closed vs 43.7% Active suggests portfolio stabilization. Post-2000 spike in Dropped projects may indicate market shift or internal process changes.

Risk Assessment Matrix

Assessment of organizational risk exposure across three dimensions:

Risk Category			
Data Quality			
Fraud Detection			
Geographic Imbalance

Audit Queue Ready

Requires Review

Monitoring Required

Recommendations

Immediate Actions (0-30 Days)

5. Initiate formal audit investigation of 42 Potential Fraud flagged projects
6. Launch data quality remediation for duration calculations—investigate negative values and extreme outliers
7. Conduct root cause analysis on post-2000 project spike, particularly dropped projects
8. Establish data governance standards for date field validation

Short-term Actions (1-3 Months)

9. Complete data cleaning and validation across all duration calculations
10. Publish audit findings and determine remediation/recovery needs for fraud cases
11. Analyze geographic performance disparities—identify barriers to African market penetration
12. Establish automated data quality monitoring for future disbursements
13. Implement cross-filtering dashboards to enable drill-down investigation by users

Strategic Actions (3-6 Months)

14. Develop predictive risk models based on cleaned historical data
15. Evaluate geographic expansion strategy in underserved regions
16. Create portfolio optimization framework—evaluate active vs. closed project balance
17. Implement real-time KPI monitoring with automated alerts for anomalies

Technical Enhancements

- Enable cross-filtering between all dashboards to allow investigative drill-down
- Add data validation rules at source to prevent negative/extreme values
- Implement automated anomaly detection algorithms for fraud prevention
- Create audit trail logging for all data changes and corrections
- Establish master data management (MDM) for Project IDs, dates, and financials

Conclusion

The BIMS dashboards reveal a mature, globally distributed loan portfolio with both significant opportunities and risks requiring immediate attention. The critical data quality issues identified must be resolved before sophisticated analytics can be reliably deployed. However, the clear identification of 42 Potential Fraud cases provides an immediate, actionable audit queue that can yield quick wins in risk mitigation.

With geographic coverage in 160 countries and 28,015 projects, the World Bank has established strong market presence. The identified geographic imbalances, particularly in Africa, present both challenges and opportunities for strategic portfolio optimization.

Immediate implementation of the recommended data quality and audit actions will position the organization for more sophisticated risk analytics, predictive modeling, and strategic portfolio management. The dashboards themselves—when coupled with proper data governance—provide excellent foundations for enterprise risk oversight.
